Lecture 1

History of mathematical logic in computer science

Dr Christoph Haase
University of Oxford
(with small changes by Javier Esparza)
History of mathematical logic in computer science

Agenda

1. Literature
2. A historical perspective on logic
3. Contemporary highlights of logic in computer science
Literature

Recommended textbooks:

- ‘Logic for Computer Scientists’, U. Schöning
- ‘Mathematical Logic for Computer Science’, M. Ben-Ari
- ‘Logic in computer science: modelling and reasoning about systems’, M. Huth and M. Ryan
- ‘Handbook of Practical Logic and Automated Reasoning’, J. Harrison

Further literature:

- ‘Gödel, Escher, Bach: an Eternal Golden Braid’, D. Hofstadter
1 Literature

2 A historical perspective on logic

3 Contemporary highlights of logic in computer science
Aristotle (384–322 BC)

Syllogism: “...a discourse in which certain (specific) things having been supposed, something different from the things supposed results of necessity because these things are so.”

All beings are mortal
All humans are beings

All humans are mortal

All $B$ are $M$
All $H$ are $B$

All $H$ are $M$
Aristotle (384–322 BC)

Syllogism: “...a discourse in which certain (specific) things having been supposed, something different from the things supposed results of necessity because these things are so.”

All beings are mortal
All humans are beings

All humans are mortal

All B are M
All H are B

All H are M

Aristotle only gave a compendium of valid arguments.
Gottfried Wilhelm Leibniz (1646–1716)

- Envisioned a calculus that allows for testing any argument for validity.

“It is obvious that if we could find characters or signs suited for expressing all our thoughts as clearly and as exactly as arithmetic expresses numbers or geometry expresses lines [. . .] all investigations which depend on reasoning would be carried out by transposing these characters and by a species of calculus.”
George Boole (1815–1864)

- Equational rules for *propositional logic* in 1854
- Built into the logic piano by William Stanley Jevons
Gottlob Frege (1848–1925) and Charles Sanders Pierce (1839–1914)

- Generalisation of propositional logic to predicate logic

“There is just one point where I have encountered a difficulty . . .”

— Bertrand Russell to Frege, 1902

“Beyond doubt . . . he was one of the most original minds of the later nineteenth century, and certainly the greatest American thinker ever.”

— Bertrand Russell about Pierce, 1959
Bertrand Russell (1872–1970) and Alfred North Whitehead (1861–1947)

- Principia Mathematica: attempt to base all of mathematics (set theory, analysis, geometry) rigorously on predicate logic
Bertrand Russell (1872–1970) and Alfred North Whitehead (1861–1947)

- Principia Mathematica: attempt to base all of mathematics (set theory, analysis, geometry) rigorously on predicate logic

(proves that 1+1=2 on page 379)
No sufficiently strong logical system can be both consistent and complete

“Kurt Gödel’s achievement in modern logic is singular and monumental - indeed it is more than a monument, it is a landmark which will remain visible far in space and time.[...] The subject of logic has certainly completely changed its nature and possibilities with Gödel’s achievement.”

— John von Neumann
Alonso Church (1903–1995) and Alan Turing (1912–1954)

- There is no algorithm that decides whether a given logical argument is valid or not
- *Turing machines* and $\lambda$-calculus lay the foundations for theoretical computer science.

Claude Shannon (1916–2001) and John Robinson (1930–2016)

Using electrical switches to compute Boolean functions:

Claude Shannon. A Symbolic Analysis of Relay and Switching Circuits, *MSc Thesis*, 1937

*Resolution and unification*: automated reasoning and logic programming:

Logic is fundamental to computer science

When I was a student, even the topologists regarded mathematical logicians as living in outer space. Today the connections between logic and computers are a matter of engineering practice at every level of computer organization.

—Martin Davis, “Influences of Mathematical Logic on Computer Science”.
Logic is everywhere

- Hardware design
- Database theory
- Automated verification
- Knowledge representation
- Programming-language theory
- Complexity theory
- Constraint satisfaction problems
Logic is everywhere

- Hardware design
- Database theory
- Automated verification
- Knowledge representation
- Programming-language theory
- Complexity theory
- Constraint satisfaction problems

... but we won’t be focussing on any of the above

This course covers the foundations of logic. We will leave applications to subsequent courses, but will emphasize computational aspects: decidability (Models of Computation), and the satisfiability problem (Algorithms)
1 Literature

2 A historical perspective on logic

3 Contemporary highlights of logic in computer science
Finding a needle amongst $1,566 \times 10^{349}$ needles

**Erdős discrepancy conjecture**

For any $C > 0$ and any infinite sequence $x_1 x_2 x_3 \cdots$ of $+1$'s and $-1$'s there exist $d, k \in \mathbb{N}$ such that

$$| \sum_{1 \leq i \leq k} x_{id} | > C.$$
Finding a needle amongst $1,566 \times 10^{349}$ needles

Erdős discrepancy conjecture

For any $C > 0$ and any infinite sequence $x_1 x_2 x_3 \cdots$ of $+1$'s and $-1$'s there exist $d, k \in \mathbb{N}$ such that

$$\left| \sum_{1 \leq i \leq k} x_{id} \right| > C.$$ 

- First shown to hold for $C = 1$ by A.R.D. Mathias in 1993
- Investigated as a Polymath project in 2009-10:
  “Given how long a finite sequence can be, it seems unlikely that we could answer this question [for $C = 2$] just by a clever search of all possibilities on a computer.”
- B. Konev and A. Lisitsa solve case $C = 2$ in 2014 using SAT solver
- 13Gb of proof that no sequence of length at least 1161 with discrepancy 2 exists
- Conjecture proved for all $C > 0$ by T. Tao in 2015
Optimal sorting networks

- Consist of wires and comparators, input flows from left to right
- Depth is the maximum number of comparators an input can encounter
- D. Knuth and R. Floyd proved optimality for $n = 1, \ldots, 8$ in 1960s
- D. Bundala and J. Závodný proved optimality for $n = 11, \ldots, 16$ in 2014 using SAT solvers
Optimal sorting networks

Leibniz’s ontological proof

Leibniz’s proof for the existence of god

1. Definition: God is a being having all perfections.
2. Definition: A perfection is a simple and absolute property.
3. Existence is a perfection.
4. If existence is part of the essence of a thing, then it is a necessary being.
5. If it is possible for a necessary being to exist, then a necessary being does exist.
6. It is possible for a being to have all perfections.
7. Therefore, a necessary being (God) does exist.

- Leibniz’s “algebra of concepts” formalised in the theorem prover Isabelle/HOL by Bentert, Benzmüller, Streit and Woltzenlogel Paleo in 2016.
- Showed validity and invalidity of Leibniz’s proof in the algebra of concepts depending on the interpretation of some informal statements.
